15 16 17 18 19	are problematic ¹ and that forces the project to look for alternatives packages. The coreutils package is good example of this situation as its license changed to GPLv3 and as result Apertis cannot provide it in the target repositories and images. The current solution of shipping an old version which precedes the license change is not tenable in the long term, as there are no upgrades with			
222 223 224 225 226 227 228	need to provide compatibility with the standard GNU coreutils packages. The reason behind is that many other packages rely on the tools it provides, and failing to do that would lead to hard to debug failures and many custom patches spread all over the archive. In this regard the strict requirement is to support the features needed to boot a target image with ideally no changes in other components. The features currently available in our coreutils-gplv2 fork are a good approximation.			
30 31 32 33	Besides these specific requirements, the are general ones common to any Ope Source Project, such as maturity and reliability. Particularly important aspecare also the available community support, the development process and us adoption.	ts		

- 34 As a summary, bellow is the list of attributes
 - License suitable for inclusion in Apertis
 - Compatible with GNU coreutils

35

• Support for the features needed to boot a target image

¹https://www.apertis.org/policies/license-expectations/

- User adoption
- Community support
- Long term solution

$_{\scriptscriptstyle 41}$ Coreutils GPLv2

- Currently Apertis provides coreutils-gplv2, with the following features
- 43 [base64 basename cat chgrp chmod chown chroot cksum comm cp csplit cut date dd
- 44 df dir dircolors dirname du echo env expand expr factor false fmt fold groups
- 45 head hostid id install join link ln logname ls md5sum md5sum.textutils mkdir
- mkfifo mknod mktemp mv nice nl nohup od paste pathchk pinky pr printenv printf
- 47 ptx pwd readlink rm rmdir seq sha1sum sha224sum sha256sum sha384sum sha512sum
- 48 shred shuf sleep sort split stat stty sum sync tac tail tee test touch tr true
- 49 tsort tty uname unexpand uniq unlink users vdir wc who whoami yes

50 Alternatives

- 51 In order to perform a comparison among different projects this section list dif-
- ferent projects and metrics of each them. These metrics are quantitative ones,
- which can obtain from the Git log, and qualitative that can be derive from the
- first ones. The value of showing all these metrics is to allow non-technical users
- to clearly understand the comparison.

56 uutils-coreutils

- 57 Link: https://github.com/uutils/coreutils
- 58 Language: Rust
- 59 License: MIT
- 60 GNU compatibility: High (it is the project goal)
- 61 User adoption: Low
- 62 Completeness: Missing 14 commands
- 63 Started: 2013
- Developers in last year: 40
 Commits in last year: 885
- 66 Project status: Very active
- 67 Community support: High
- 67 Community support: file
- Maturity: Medium

69 Pros

70

71

- High GNU compatibility
- High community support
- High community impact
- Portability in mind
- Ongoing development

- Implemented in a modern memory safe language
- Interest from Debian developers

77 Cons

78

- Missing commands and features
- Not used in production environments
- Depends on many Rust crates, which may not all be already available in Debian

Notes

- Semi-done: cp expr install ls more od printf sort split tail test date join df
- To do: choon csplit dd numfmt pr stty
 - Missing compared to coreutils-gplv2: csplit dd dir pr stty vdir
 - Builds successfully on Apertis using the available Rust compiler
- Initial tests for basic features were successful
 - A Debian Developer already ran some tests booting a Debian graphical session with GNOME using uutils-coreutils²

91 BSDutils

- 92 Link: https://github.com/dcantrell/bsdutils
- Language: CLicense: BSD
- GNU compatibility: Low (project is only a port of OpenBSD compatible with
- 96 Linux)
- 97 User adoption: Very low
- ⁹⁸ Completeness: Missing 25 commands, long options unsupported, other differ-
- ences Started: 2019
- Developers in last year: 1
- 101 Commits in last year: 86
- 102 Project status: Active
- 103 Community support: Low (base project high)
- Maturity: Medium (base project high)

os Pros

106

107

110

111

112

- Linux support
- Based on OpenBSD, which is a mature project

108 Cons

- Missing commands and features
- Not fully compatible with GNU as it is a port from OpenBSD
- Low community support for the port itself
- Not used in production environments

²https://sylvestre.ledru.info/blog/2021/03/09/debian-running-on-rust-coreutils

- Original project only supports OpenBSD, Linux support added in a low activity fork
 - Requires libbsd-dev

Notes 116

113

114

115

117

118

119

120

121

122

- This project is a port of tools from OpenBSD to have an BSD-licensed and lightweight replacement of GNU coreutils
- Provides a set of scripts to import new OpenBSD versions and a set of patches to be applied and provide Linux compatibility
- In order to upstream contributions might need to be done to this specific project or to OpenBSD
- Missing from coreutils-gplv2: base64 cksum dir dircolors hostid link 123 md5sum md5sum.textutils od pathchk pinky ptx seq sha1sum sha224sum 124 sha256sum sha384sum sha512sum shred shuf sum tac tail unlink vdir 125

Busybox

```
Link: https://busybox.net/
127
```

Language: C 128

License: GPLv2

GNU compatibility: High (compatibility in mind but a subset of features) 130

User adoption: Very high

Completeness: Commands with limited features 132

Started: 1999

Developers in last year: 27 134 Commits in last year: 299 Project status: Very active Community support: High

Maturity: High

Pros

139

140

141

143

145

- High GNU compatibility
 - High community support
- Very low footprint 142
 - Already part of Apertis

Cons 144

Supports a subset of features

Nbase

```
Link: https://github.com/cheusov/nbase
```

Language: C 148 License: BSD

GNU compatibility: Low (project is only a port of NetBSD compatible with

Linux)

- User adoption: Very low
- Completeness: Missing 33 commands
- Started: 2015 154
- Developers in last year: 1 Commits in last year: 119 156 Project status: Active 157 Community support: Low
- Maturity: Medium

Pros 160

158

161

162

164

165

167

169

172

173

- Linux support
 - Based on NetBSD, which is a mature project

Cons

- Missing commands and features
- Not fully compatible with GNU as it is a port from NetBSD
- Low community support
- Not used in production environments
- Requires NetBSD make, mk-configure, libbsd
- Original project only supports NetBSD, Linux support added in a low activity fork

Notes 171

- This project is a port of tools from NetBSD compatible with other Unix like systems
- Missing from coreutils-gplv2: [base64 charp chown chroot dir dircolors 174 factor groups hostid install link md5sum md5sum.textutils od pathchk pinky ptx readlink sha1sum sha224sum sha256sum sha384sum sha512sum shred 176 shuf sum tac unlink users vdir who whoami 177

FreeBSD

- Link: https://github.com/freebsd/freebsd/tree/master/bin Link: https://github.com/freebsd/freebsd/tree/master/usr.bin 180
- Language: C 181 License: FreeBSD 182
- GNU compatibility: Very low
- User adoption: High 184
- Developers in last year: 72 (on usr.bin) Commits in last year: 423 (on usr.bin)
- Project status: Active Community support: High 188
- Maturity: High

Pros 190

191

• High community support

2 Cons

193

194

195

- Missing commands and features
- No Linux support
 - No GNU compatibility

196 Sbase and Ubase

```
Link: https://gitlab.com/garbeam/src/-/tree/master/bin/sbase
```

- Link: https://gitlab.com/garbeam/src/-/tree/master/bin/ubase
- 199 Language: C
- 200 Project status: Inactive, no activity since 2016
- 201 Community support: None
- 202 Pros

203

- Linux support
- 204 Cons
 - Project inactive

6 Heirloom

- Link: https://en.wikipedia.org/wiki/Heirloom_Project
- Link: https://wiki.archlinux.org/index.php/Heirloom
- 209 Language: C
- 210 Project status: No activity since 2007
- 211 Community support: None
- 212 **Pros**

213

215

- Linux support
- Cons
 - Project inactive

216 Replacement: uutils-coreutils

Based on the above comparison the best option is uutils-coreutils, since it is
the only one with the explicit goal of providing a fully compatible alternative
to GNU coreutils, and it has a good community support which most probably
will continue and improve in the future. The main risk is the current low user
adoption and the lack of usage in production scenarios. It is worth to mention

that the main license used in the project is MIT but further analysis needs to be done to confirm the licensing of all the used dependencies.

These risks enumerated will be handled by the testing and migration in order to provide a reliable approach.

- As it has been mentioned the license used is MIT, and detailed information
- ²²⁷ about its dependencies can be found in the FOSSA analysis³. Unfortunately,
- this report is not reliable since it shows several incorrect dependencies.
- 29 The following list shows the dependencies as reported by cargo

Package	License
ansi term	MIT
arrayvec	MIT OR Apache-2.0
autocfg	MIT OR Apache-2.0
backtrace-sys	MIT OR Apache-2.0
bitflags	MIT OR Apache-2.0

Testing

232

234

235

236

237

239

241

243

244

245

In order to confirm the missing features/commands in the uutils-coreutils 231 which are required by Apertis a testing needs to be performed. The steps proposed are: 233

- Run initial tests on target images
 - Test booting standard target images
 - Test installing/removing packages
- Run current coreutils-gplv2 test plan with uutils-coreutils
- Run uutils-coreutils as default on development environments
- Make uutils-coreutils and all the Rust crates it depends on available in Debian
- Provide long-term maintenance of the new packages in Debian as well Note that some effort is being driven by uutils-coreutils community to use the coreutils test case to generate a report for the still missing features. This will be a nice to have feature but it is more than it is actually required for this stage.

$_{ ext{ iny 46}}$ Initial test and results

As part of an initial test using uutils-coreutils the following steps have been taken

- Replace utilities from coreutils-gplv2 with the ones provided by uutilscoreutils
- Boot target image without issues
- Reinstall package libc6 without issues

These initial results are promising, however more detailed tests should be planned and executed to spot potential issues.

$_{\scriptscriptstyle 55}$ Migration

250

25

252

261

263

264

266

268

270

As of v2022dev3, uutils-coreutils is the default coreutils implementation shipped on the Apertis reference images for devices, while GNU coreutils remains in use in the package building pipelines and on the SDK images. This work involved importing Debian's rust-coreutils⁴ package along with its dependencies.

The upstream Debian package isn't aimed at replacing coreutils yet, meaning some packaging changes were necessary to get Apertis images to build using rust-coreutils only:

- Change the package's priority from optional to required: this ensures debootstrap will pick up this package when bootstrapping the system
- Add Conflicts/Breaks/Provides/Replaces relationships so all dependencies are satisfied and conflicting packages (such as coreutils-gplv2) cannot be installed
- Install the binaries to /bin and /usr/bin instead of /usr/libexec/rust-coreutils

Additionally, a few patches were necessary to implement missing command-line 271 options and most of them are in the process of being upstreamed. Some of our patches still require more work, especially regarding SELinux-related options: 273 for now, we made sure the corresponding command-line options would be recognized, but the associated behavior isn't implemented yet. Since SELinux is not 275 used in Apertis this was enough to ensure images could be built successfully, but these patches are not suitable for upstreaming. Implementing full SELinux 277 support is not currently in the scope of Apertis, maintaining the downstream patches until upstream implements proper support is not going to be particu-279 larly problematic. 280

coreutils-gplv2 have been consequently removed from Apertis v2022dev3 and later repository.
